In looking at this data, I would still have to question why all gases are not be gathered. I understand that FMC has claimed from a process knowledge standpoint that if no phosphine is detected, no other gases will be either and that they have blamed the other gases to be interference from these gases.

Regardless, this should be something that we need to further evaluate with the Post Closure modifications.

I also am concerned with their claiming that collecting data from earlier than 2006 would cause delays with the on-going activities. This data should be maintained and frequently reviewed to ensure no trending is going on. With my experience, this should not require the additional 30 days to complete perhaps one week or even two.

These are some of my thoughts with this information that has been provided.

Kelly
